

## The one stop service for all your tape and film digitisation needs.

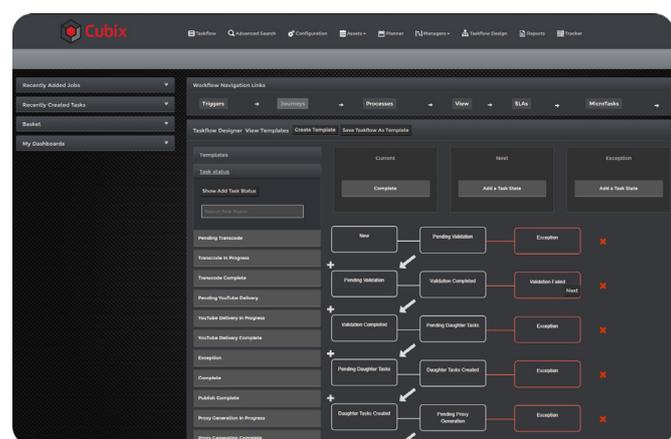

Spot and Spin offer a range of digitisation services for tape and film based material, focused primarily around our fully automated ingest processes with the capability of scaling up to manage huge libraries. We can also provide a bespoke service for low volume and rare tape and film formats.

Spot & Spin supports VHS, DV, Mini DV, U-Matic, D3, D5, XDCAM Disk, DAT (for audio tapes), all variants of Digibeta (SP/SX/etc), HDCAM and HDCAM SR just to name a few.

For film scanning we support formats such as 8mm /16mm /35mm /65mm /70mm, including 9.5mm /17.5mm /22mm and 28mm, if required.

All the in-house bulk ingest systems are configured with industry standard Sony Flexicarts and Encoders. These are directly integrated, controlled and managed by Cubix Yunify, our own automation, orchestration and transcode solution.

Our systems allow for completely customised workflows for each client, from receiving the order to the first barcode scan, and then all the way through to content delivery or publishing. With excellent levels of reporting and transparency throughout to include such actions as notifications, review and approve links, transcodes, multiple publishing points and more.

All digitisation projects are provided with their own secure Portal into Cubix Yunify to provide the ability to track assets and projects throughout the whole process. Our Portal allows the viewing of proxies, metadata entry, timecode based content tagging, online trimming and editing. All of our proxies are frame-accurate and suitable for use within NLE environments.

The Spot & Spin bulk ingest service is deployed at our secure site in North West London, complete with dedicated resilient 1Gb high speed connectivity.

Cubix Yunify is fully integrated at our facility with accelerated file transfer mechanisms such as Aspera, Signiant, MASV, FTP and our own file acceleration - CubixUDT, to deliver directly to your preferred storage location the moment the content is available.

If you're migrating content off-prem and into the cloud, we are able to deliver directly to multiple cloud storage locations including Backblaze B2, Amazon S3/Glacier, Google Nearline, Wasabi, MatrixStore Cloud and more.

Prices start from as little as £18 per content hour, and 2p per foot for film scanning, with all prices including our five point spot check (auto and full QC available at additional cost) and digital delivery. All prices are calculated based on delivered material and are calculated to the frame. For more information please visit:
